4.1.2.9 - Appendix I: Specific SPD's for Virtual Channel SDRAM (VCSDRAM).

Date of last update: 11/1/98

- 1.0 Introduction: This appendix describes the Presence Detects for Virtual Channel Synchronous DRAM Modules with SPD revision level 2 (02h). These PD's are those referenced in the SPD standard document for "Specific Features". The following PD fields will occur, in the order presented, in table 1.1. Further descriptions of bytes 0 and 1 are found in the SPD standard. Further description of byte 2 is found in appendix A of the SPD standard.
- 1.1 Address map: The following is the SPD address map for VCSDRAM, which describes where the individual LUT–Entries/bytes will be held in the serial EEPROM:

| Byte Number | Function described | Notes |
|-------------|---|-------------|
| 0 | Defines # bytes written into serial memory at module mfgr | 1 |
| 1 | Total # bytes of SPD memory device | 2 |
| 2 | Fundamental memory type (FPM, EDO, SDRAM) from appendix A | |
| 3 | # Row Addresses on this assembly | 3 |
| 4 | # Column Addresses on this assembly | 9 |
| 5 | # Module Banks on this Assembly | |
| 6 | Data Width of this assembly | |
| 7 | Data Width continuation | |
| 8 | Voltage interface standard of this assembly | |
| 9 | VCSDRAM Cycle time at Max. Supported CAS Latency (CL), CL=X | 4 |
| 10 | VCSDRAM Access from Clock at CL=X | 4 |
| 11 | DIMM Configuration type (Non-parity, Parity, ECC) | |
| 12 | Refresh Rate/Type | 4,5 |
| 13 | VCSDRAM width, Primary DRAM | ,- |
| 14 | Error Checking VCSDRAM data width | |
| 15 | Minimum Clock Delay, Back to Back Random Column Addresses | |
| 16 | Burst Lengths Supported | |
| 17 | # Banks on Each VCSDRAM device | 4 |
| 18 | CAS# Latencies Supported | 4 |
| 19 | CS# Latency | 4 |
| | · | 4 |
| 20 | Write Latency | - 4 |
| 21 | VCSDRAM Module Attributes | |
| 22 | VCSDRAM Device Attributes: General | |
| 23 | Minimum Clock Cycle Time at CL X–1 | 4 |
| 24 | Maximum Data Access Time from Clock @ CL X-1 | 4 |
| 25 | Minimum Clock Cycle Time at CL X–2 | 4 |
| 26 | Maximum Data Access Time from Clock @ CL X-2 | 4 |
| 27 | Minimum Row Precharge Time | 4 |

JEDEC Standard No. 21-C Page 4.1.2.9 - 2

notes:

- 1) This will be programmed as 128 bytes for the 168 pin DIMM Module.
- 2) This must be programmed as 256 bytes, 256 byte EEPROM's will be used for SPD on 168 pin VCSDRAM DIMMs.
- High order bit defines if assembly has "redundant" addressing (if set to "1", highest order RAS# address must be re-sent as highest order CAS# address.)
- 4) From data sheet.
- 5) High order bit (MSB) is Self Refresh 'flag'. If bit seven is "1", assembly supports self refresh.
- 6) The JEDEC spec. specifies that these bytes are optional for 66MHz applications. If they are not included then the SPD revision level (byte 62) is set at revision 1 (01h).
- 7) The JEDEC spec specifies that these bytes are optional.
- 8) Module suppliers will need to assure that these bytes are open for reads/writes by Customer.
- 9) Including channel addresses. Usage of Column Addresses of VCSDRAM is different from SDRAM.
- 10) Changed from Minimum RAS to CAS delay in SDRAM.
- 11) Newly added for VCSDRAM. From Data Sheet
- 12) Revision level 2 (02h); This SPD contents for VCSDRAM are the same level of level 2 SPD for SDRAM
- 2.0 For Reference, Bytes 0 2. Descriptions of bytes 0 and 1 can be found in the main body of the SPD standard, and byte 2 is detailed in appendix A to this standard. For reference and convenience, applicable portions of their descriptions are presented again:
- 2.1 BYTE 0, From General SPD Standard, Number of Bytes used by Module Manufacturer: This field describes the total number of bytes used by the module manufacturer for the SPD data and any (optional) specific supplier information. The byte count includes the fields for all required and optional data.

| Number SPD Bytes | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 4 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 6 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| 8 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| 10 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| 11 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |
| | | | | | | | | |
| 128 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | | | | | | | | |
| 254 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 255 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

2.2 Byte 1, From General SPD Standard, Total SPD Memory Size: This field describes the total size of the serial memory used to hold the Serial Presence Detect data. The following lookup table describes the possible serial memory densities (in bytes) along with the corresponding descriptor:

| Serial Memory Density | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Invalid | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 2 Bytes | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 4 Bytes | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| 8 Bytes | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 16 Bytes | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| 32 Bytes | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 64 Bytes | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 128 Bytes | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| 256 Bytes | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 512 Bytes | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| 1024 Bytes | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| 2048 Bytes | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |
| 4096 Bytes | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 |
| 8192 Bytes | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| 16384 Bytes | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| | | | | | | | | |
| · | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

2.3 Byte 2, From Appendix A, Memory Type: This byte describes the fundamental memory type (or technology) implemented on the module:

| Fundamental Mem. Type | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| | | | | | | | | |
| VCSDRAM | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

- 3.0 Data Type(s): Even though many of the PD's seem to be binary numbers representing the feature they are describing, they are considered Look Up Table (LUT) entries.
- 4.0 The following PD bytes are those specific to modules implementing Synchronous DRAM technology. Note that these full descriptions start at byte 3 below and are not covered in the main body of the SPD standard since they are specific to a given fundamental memory type/technology
- 4.1 Byte 3, Number of ROW Addresses: This field describes the Row addressing on the module. If there is one physical bank on the module OR if there are two physical banks of the same size and organization, then bits 0–3 are used to represent the number of row addresses for each physical bank. If the module has two physical banks of asymmetric size, then bits 0–3 represent the number of row addresses for physical bank 1 and bits 4–7 represent the number of row addresses for physical bank 2. Note that these do not include the Bank Address pin since physical bank selection on DIMM modules is asserted on dedicated BA (Bank Address) pins. Also note that if the module employs redundant addressing, then it is denoted in Byte 21, bit 6. Examples of Byte 3 implementation include:

| | # Row Addr | # Row Addr | Module | Discrete | Byte 3 |
|--------|-------------|-------------|---------------|--------------|-----------|
| #Banks | Bank 1 | Bank2 | Orgainzation | Used | Contents |
| 1 | 11,RA0–RA10 | N/A | 2Mx64 | 2Mx8 | 0000 1011 |
| 2 | 11,RA0-RA10 | 11,RA0-RA10 | 2x2Mx64 | 2Mx8 | 0000 1011 |
| 2 | 11,RA0-RA10 | 11,RA0-RA10 | 2Mx64 & 1Mx64 | 2Mx8 & 1Mx16 | 1011 1011 |

| | | | | | _ | OR- No. of Rov | Row addresses waddresses on ye the same dep | Bank 1 and 2 |
|----------------------------------|-----------|--------------------|--|--------------|-------|----------------|---|--------------|

4.2 Byte 4, Number of Column Addresses: This field describes the Column addressing on the module. Even though usage of Column address of VCSDRAM is different from SDRAM, in order to keep consistency, the number of addresses used in READ or WRITE command should be written. (ie. Including channel addresses.) If there is one physical bank on the module OR if there are two physical banks of the same size, then bits 0–3 are used to represent the number of column addresses for each physical bank. If the module has two physical banks of asymmetric size, then bits 0–3 represent the number of column addresses for physical bank 1 and bits 4–7 represent the number of column addresses for physical bank 2.

| #Banks | # Col Addr Bank 1 | # Col AddrModule Bank2 | Discrete Organization | Used | Byte 3 Contents |
|--------|----------------------|---------------------------|--------------------------|--------------|--------------------|
| 1 | 9,CA0-CA8 | N/A | 2Mx64 | 2Mx8 | 0000 1001 |

4.3 Byte 5, Number of Banks on module: This field describes the number of physical banks on the VCSDRAM Module. This is not to be confused with the number of logical banks on a given VCSDRAM device which are defined in Byte 17:

| Number of Banks | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-----------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 4 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| 5 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 6 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 7 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| 8 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 9 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| 10 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| 11 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 |
| 12 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 |
| 13 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| 14 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| | | | | | | | | |
| • | | | | | | | | |
| 254 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 255 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

4.4 Bytes 6 & 7, Module Data Width: Bytes 6 and 7 are used to designate the module's data width. The data width is presented as a 16 bit word; bit 0 of byte 6 becomes the LSB of the 16 bit width identifier and bit 7 of byte 7 becomes the MSB. Consequently, if the module has a width of less than 255 bits wide, byte 7 will be 00h. If the data width is 256 bits or higher, byte 7 is used in conjunction with byte 6 to designate the total module width. For example, if the module's

| data width is: | then byte 7 is | and byte 6 is: |
|----------------|----------------|----------------|
| 64 | 0000 0000 | 0100 0000 |
| 72 | 0000 0000 | 0100 1000 |
| 80 | 0000 0000 | 0101 0000 |
| 576 | 0000 0010 | 0100 0000 |

4.4.1 Byte 6:

| Data Width | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 2 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| 3 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| | | | | | | 1. | | |
| 32 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 |
| | | | | | | | | |
| 36 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 |
| | | | | | | | | |
| 64 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| | | | | | | 1. | | |
| 72 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 |
| | | | | | | | | |
| 80 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| | | | | | | | | |
| 128 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | | | | | | | | |
| 144 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| | | | | | | | | |
| 254 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 255 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

4.4.2 Byte 7, Module Data Width Continued: This byte will be left at 00h if the original module data width is less than 256 bits wide. If the width is more than 255, then this byte will be used in conjunction with byte 6.

| Module Data Width Cont. | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| 0(+) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 256(+) | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 512(+) | 0 | 0 | 0 | 0 | 0 | 0 | 1 | Х |
| 1024(+) | 0 | 0 | 0 | 0 | 0 | 1 | Х | Х |
| 2048(+) | 0 | 0 | 0 | 0 | 1 | Х | Х | Х |
| | | | | | | | | |

4.5 Byte 8, Module Interface Levels: This field describes the module's voltage interface:

| Voltage Interface | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| 5.0 Volt/TTL | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| LVTTL | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| HSTL 1.5 V | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| SSTL 3.3 V | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| SSTL 2.5 V | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| TBD | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| TBD | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

Byte 9, VCSDRAM Cycle time (tCYC): This byte defines the minimum cycle time for the VCSDRAM Module at the highest CAS Latency, CAS Latency=X, defined in byte 18. If other CAS latencies are supported, then the associated minimum cycle times are written into byte 23 and 25. Byte 9, Cycle time for CAS Latency = X, is split into two nibbles: the higher order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the lower order nibble (bits 0 through 3) has a granularity of 1/10 ns and is added to the value designated by the higher nibble. For example, if

Bits 7:4 are and bits 3:0 are then the cycle time is 1010 0101 (10 ns) + (0.5 ns) = 10.5 ns

| 1010 | 0101 | (10110) | (0.5 115) | - 10.0 110 | | | | |
|-------------|-------|---------|----------------|-------------------------------|----------------|-------|-----------------|-------|
| Nanoseconds | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

4.7 Byte 10, VCSDRAM Access time from Clock (tAC): This byte defines the maximum clock to data out for the module. This is the Clock to data out specification at the highest given CAS Latency specified/depicted in byte 18 of this SPD specification/ standard. If other CAS latencies are supported, then the associated Maximum Clock Access times are written into bytes 24 and 26.

The byte is split into two nibbles: the higher order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the lower order nibble (bits 0 through 3) has a granularity of 1/10 ns and is added to the value designated by the higher nibble. For example, if

Bits 7:4 are and bits 3:0 are then the cycle time is 1001 0000 (9 ns) + (0.0 ns) = 9.0 ns

| Nanoseconds | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | | | | |

4.10 Byte 13, VCSDRAM width, Primary VCSDRAM: Bits 0–6 of this byte relate the primary data VCSDRAM's width; bit 7 is a flag which is set to "1" when there is a 2nd physical bank on the module which is of different size from the 1st physical bank. Bit 7 set to "1" indicates that the 2nd physical bank's data RAMs are 2X the width of those on the 1st physical bank. If there is a second physical bank of same size and organization as the first , then bit 7 remains as "0" and error checking VCSDRAM width for both banks is expressed using bits 0–6. The primary VCSDRAM is that which is used for data; examples of primary (data) VCSDRAM widths are x4, x8, x16, x32. Note that if the module is made with VCSDRAMs which provide for data and error checking e.g. x9, x18, x36, then it is also designated in this field. Examples of VCSDRAM DIMM using 1 and 2 banks of symmetrical and asymmetrical size:

| | Physical Bank 1 | Physical Bank 2 Primary | Physical Bank 1 | Physical Bank 2 | Possible (16Mb based) | Byte 13 |
|-----------------|--------------------------|-------------------------------|---------------------------------|---------------------------------|--------------------------|-----------|

4.11 Byte 14, Error Checking VCSDRAM data width: If the module incorporates error checking and if the primary data VCSDRAM does not include these bits; i.e. there are separate error checking VCSDRAMs, then the error checking VCSDRAM's width is expressed in this byte. Bits 0–6 of this byte relate the error checking VCSDRAMs width; bit 7 is a flag which is set to "1" when there is a 2nd physical bank on the module which is of different size from the 1st physical bank. Bit 7 set to "1" indicates that Bank 2's error checking RAMs are 2X the width of those on the 1st physical bank. If there is a second physical bank of same size and organization as the first , then bit 7 remains as "0" and error checking VCSDRAM width for both physical banks is expressed using bits 0–6. Examples of error checking VCSDRAM widths with 1 and 2 physical banks of Symmetric and Asymmetric sizing include:

| Physical Bank 1 Primary | Physical Bank 2 Primary | Physical Bank 1 | Physical Bank 2 | Possible (16Mb based) | Byte 14 |

| | | | | | | | | |
| 255 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

4.15 Byte 18, VCSDRAM Device Attributes, CAS# Latency: This byte describes which of the programmable CAS# Latencies are supported by the Module. If the bit is "1", then that CAS# Latency is supported on the module; If the bit is "0", then that CAS# Latency is not supported by the module. Bytes 9,10,23–26 all relate CAS Latency dependent timings.

| I | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|---|-------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Ī | TBD | CAS# |
| l | | Latency = 7 | Latency = 6 | Latency = 5 | Latency = 4 | Latency = 3 | Latency = 2 | Latency = 1 |
| Ī | 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 |

4.16 Byte 19, VCSDRAM Device Attributes, CS# Latency: This byte describes which of the programmable CS# Latencies are acceptable for the Module. If the bit is "1", then that CS# Latency is supported on the module; If the bit is "0", then that CS# Latency is not supported by the module.

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| TBD | CS# Latency = 6 | CS# Latency = 5 | CS# Latency = 4 | CS# Latency = 3 | CS# Latency = 2 | CS# Latency = 1 | CS# Latency = 0 |
| 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 |

4.17 Byte 20, VCSDRAM Device Attributes, WE# Latency: This byte describes which of the programmable WE# Latencies are acceptable for the Module. If the bit is "1", then that WE# Latency is supported on the module; If the bit is "0", then that WE# Latency is not supported by the module.

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| TBD | WE# |
| | Latency = 6 | Latency = 5 | Latency = 4 | Latency = 3 | Latency = 2 | Latency = 1 | Latency = 0 |
| 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 |

4.18 Byte 21, VCSDRAM Module Attributes: This byte depicts various aspects of the module. It details various unrelated but critical elements pertinent to the module. A given module characteristic is detailed in the designated bit; if the aspect is TRUE, then the bit is "1". Conversely, if the aspect is FALSE, then the designated bit is "0".

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|--------------------------|-----------------------------|---------------------------|-------------------------|---------------------------|--|---|
| TBD | *Redundant Addressing | Differential Clock Input | Registered DQMB Inputs | Buffered DQMB Inputs | On-Card PLL (Clock) | **Registered Address and Control Inputs | **Buffered Address and Control Inputs |
| 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 |

^{*} Redundant addressing implies the use of VCSDRAMs having the same address depth (e.g. 4Mx4 mixed with 4Mx16) in the same 8 byte quad word, but having different RAS/CAS addressing and/or different numbers of device banks. Actual implementation is not yet determined.

4.19 Byte 22, VCSDRAM Device Attributes, General: This byte depicts various aspects of the VCSDRAMs on the module. It details various unrelated but critical elements pertinent to the VCSDRAMs. A given VCSDRAM characteristic is detailed in the designated bit; unless otherwise specified, if the aspect is TRUE, then the bit is "1". Conversely, if the aspect is FALSE, then the designated bit is "0".

| Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------|-------|---|---|--|--|---|---|
| TBD | TBD | *Upper Vcc tolerance: 0=10% 1=5% | *Lower Vcc tolerance: 0=10% 1=5% | Supports Write1/Read Burst 0=false 1=true | Supports Precharge All 0=false 1=true | Supports Auto-Precharge 0=false 1=true | Supports Early RAS# Precharge 0=false 1=true |
| 0 | 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 | 1 or 0 |

^{*} Tolerance refers to the voltage range under which the VCSDRAMs operate.

^{**} Address, RAS, CAS, WE, CKE, CS

^{**} Early RAS Precharge is supported by all devices. This bit can only be a "1".

4.20 Byte 23: Minimum Clock Cycle Time at reduced CAS latency, X–1: The highest CAS latency identified in byte 18 is X and the timing values associated with CAS Latency 'X' are found at byte locations 9 and 10. Byte 23 denotes the minimum cycle time at CAS X–1.

For example, if byte 18 denotes CAS latencies of 1–3, then X is 3 and X–1 is 2. Byte 23 then denotes the minimum cycle time at CAS Latency = 2.

Byte 23 is split into two nibbles: the higher order nibble (bits 4 through 7) designate the cycle time to a granularity of 1 ns; the value presented by the lower order nibble (bits 0 through 3) has a granularity of 1/10 ns and is added to the value designated by the higher nibble. For example, if

Bits 7:4 are 1001

and bits 3:0 are 0101

then the cycle time is (9 ns) + (0.5 ns) = 9.5 ns

4.28: Byte 31: Density of each bank on module: This byte describes the density of each physical bank on the VCSDRAM DIMM. This byte will have at least one bit set to "1" to represent at least one banks density. If there are more than one bank on the module (as represented in byte #5) and they have the same density, then only one bit is set in this field. If the module has more than one bank of different sizes then more than one bit will be set; each bit set for each density represented. For example:

| # Banks | Densiy of Bank 1 | Density of bank 2 | Byte 31 contents |
|---------|------------------|-------------------|------------------|
| 1 | 32 M Byte | N/A | 0000 1000 |
| 2 | 32 M Byte | 32 M Byte | 0000 1000 |
| 2 | 32 M Byte | 16 M Byte | 0000 1100 |

| | | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

| Dens | sity | 512 M Byte | 256 M Byte | 128 M Byte | 64 M Byte | 32 M Byte | 16 M Byte | 8 M Byte | 4 M Byte |
| N/ | ′ | 0/1 | 0/1 | 0/1 | 0/1 | 0/1 | 0/1 | 0/1 | 0/1 |

4.29 Byte 32, Address and Command signal input setup time before clock: This field describes the input setup time before the rising edge of clock. Since this value can be either negative or positive, provisions have been made to accomodate both. If one byte starts with a Zero in bit 7, then the input setup time is positive. If the byte starts with a One in bit 7, then the value is negative.

For example, if

| Nanoseconds | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

4.30 Byte 33, Address and Command signal input hold times after clock: This field describes the input hold time after the rising edge of clock. Since this value can be either negative or positive, provisions have been made to accommodate both. If one byte starts with a Zero in bit 7, then the input setup time is positive. If the byte starts with a One in bit 7, then the value is negative.

For example, if

| Nanoseconds | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|---------------------------|-------|-------|----------------|------------------|-------------------|-------|----------------|-------|

4.33 Bytes 36, PrefetchRead Latency. This byte describes the the latency from PrefetchRead Command to Data output of each physical bank on the VCSDRAM DIMM. If there is one physical bank on the module OR if there are two physical banks which have the same PrefetchRead Latency, then bits 0–3 are used to represent the latency for each physical bank. If the module has two physical banks of different latency, then bits 0–3 represent the latency for physical bank 1 and bits 4–7 represent the latency for physical bank 2.

For example:

| # Banks | Latency of Bank 1 | Latency of bank 2 | Byte 36 contents |
|---------|-------------------|-------------------|------------------|
| 1 | 5 Clocks | N/A | 0000 0101 |
| 2 | 5 Clocks | 5 Clocks | 0000 0101 |
| 2 | 5 Clocks | 4 Clocks | 0100 0101 |

- 4.38 + Bytes 41–61, Superset information. See appropriate Superset appendices.
- 4.39 Byte 62, Serial Presence Detect Revision: As SPD definition may be updated, it becomes necessary to identify the version of SPD which is being depicted. For keeping the consistency to SDRAM DIMM, use REV 2 for the initial release because the contents of the initial release of VCSDRAM SPD are based on REV 2 of SDRAM DIMM:

| SPD Revision | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
|-------------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Undefined | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| REV 2 (Initial Release) | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| | | | | | | | | |
